DATE MAILED: 12/23/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/479,886

Applicant(s)

KAKIUCHI ET AL.

Examiner

Jon Chang

Art Unit

2623

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 10 January 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on ____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☒ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. ____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) ____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). ____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: .

Claim Rejections - 35 USC § 112

1. Claim 16 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 16 recites, "halting the process..." It is unclear as to what process is being referred to. Each step is a process, as well as the entire method.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-2, 7 and 14-16 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Patent 6,463,176 to Matsugu et al. (hereinafter "Matsugu").

As to claim 1, Matsugu discloses an image recognition device, comprising:

an element matching means to match a plurality of input pattern elements obtained by dividing an input image into a plurality of regions with the corresponding

Art Unit: 2623

target pattern elements of a target pattern (column 5, lines 22-30; Fig.1A, element A5; column 6, lines 50-57, the elements are mapped to a lattice space which is partitioned, i.e., divided); and

a pattern detection means to detect relative positions of said plurality of input pattern elements compared with reference arrangement data of said target pattern elements in order to recognize whether said input image includes said target pattern (column 7, lines 49-54; Fig.1A).

As to claim 2, Matsugu discloses an image recognition device, comprising:

a dictionary generating unit which stores dictionary data for each pattern element in a target pattern (column 5, lines 28-30; Fig.1A, element A4);

an element matching unit, which compares and matches input image pattern data which is provided as input against said dictionary data stored in said dictionary generating unit (column 5, lines 27-28; Fig.1A, element A5);

an arrangement data generating unit which stores the position data representing the arrangement of the target pattern elements (column 7, lines 49-51); and

a pattern detection unit, which based on the output of said element matching unit and said position data from said arrangement data generating unit, determines whether said target pattern can be found in said input image pattern data (column 7, line 52 to column 8, line 9).

As to claim 7, Matsugu discloses an image processing device, comprising:

an element matching means to match a plurality of input pattern elements obtained by dividing an input image into a plurality of regions with the corresponding

Art Unit: 2623

target pattern elements of a target pattern (column 5, lines 22-30; Fig.1A, element A5; the elements are mapped to a lattice space which is partitioned, column 6, lines 50-57);

a pattern detection means to detect relative positions of said plurality of input pattern elements compared with a reference arrangement data of said target pattern elements in order to recognize whether said input image includes said target pattern (column 7, line 52 to column 8, line 9) ;

and

a control means to control output of said input image to an output device when said pattern detection means recognizes said input image includes said target pattern (column 4, lines 62-63).

As to claim 14, Matsugu discloses a method of processing an image, said method comprising:

inputting a reference image (column 5, lines 28-29);

determining target pattern elements for said reference image by dividing said reference image into a plurality of regions (column 6, lines 50-57);

determining arrangement data for said target pattern elements (column 7, lines 49-50);

inputting data for an input image (Fig.1B, block S11);

determining input elements for said input image by dividing said input image into said plurality of regions corresponding to said reference image (Fig.1B, blocks S12 and S13; column 6, lines 50-57); and

Art Unit: 2623

comparing said target pattern elements and said input elements (Fig.1B, block S15).

As to claim 15, Matsugu discloses the method of claim 14, wherein said comparing comprises comparing said target pattern elements and said input elements relative position to each other using said arrangement data (column 7, lines 49-54).

As to claim 16, Matsugu discloses the method of claim 14 further comprising halting the process if said target pattern elements include said input elements based on said comparing (Fig.1B, "END").

4. Claims 1-16 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Patent 6,370,271 to Fu et al. (hereinafter "Fu").

As to claim 1, Fu discloses an image recognition device, comprising:

an element matching means to match a plurality of input pattern elements obtained by dividing an input image into a plurality of regions with the corresponding target pattern elements of a target pattern (column 2, line 65 to column 3, line 1; column 3, lines 7-11; Figures 1A-1E; Fig.6, elements 603, 604, 605); and

a pattern detection means to detect relative positions of said plurality of input pattern elements compared with reference arrangement data of said target pattern elements in order to recognize whether said input image includes said target pattern ().

As to claim 2, Fu discloses an image recognition device, comprising:

a dictionary generating unit which stores dictionary data for each pattern element in a target pattern (column 4, line 63);

Art Unit: 2623

an element matching unit, which compares and matches input image pattern data which is provided as input against said dictionary data stored in said dictionary generating unit (column 2, line 65 to column 3, line 1; column 3, lines 7-11; Figures 1A-1E; Fig.6, elements 603, 604, 605);

an arrangement data generating unit which stores the position data representing the arrangement of the target pattern elements (column 3, lines 4-5); and

a pattern detection unit, which based on the output of said element matching unit and said position data from said arrangement data generating unit, determines whether said target pattern can be found in said input image pattern data (column 3, lines 4-5; Figures 1A-1E; Fig.6, elements 608, 609).

Regarding claims 3-6, Fu further discloses that the dictionary generating unit, the element matching unit, the arrangement data generating unit, and the pattern detection unit comprising software routines (column 5, lines 22-24).

As to claim 7, Fu discloses an image processing device, comprising:

an element matching means to match a plurality of input pattern elements obtained by dividing an input image into a plurality of regions with the corresponding target pattern elements of a target pattern (column 2, line 65 to column 3, line 1; column 3, lines 7-11; Figures 1A-1E; Fig.6, elements 603, 604, 605);

a pattern detection means to detect relative positions of said plurality of input pattern elements compared with a reference arrangement data of said target pattern elements in order to recognize whether said input image includes said target pattern (column 3, lines 4-5; Figures 1A-1E; Fig.6, elements 608, 609) ; and

Art Unit: 2623

a control means to control output of said input image to an output device when said pattern detection means recognizes said input image includes said target pattern (Figs 1A-1E; note the printer).

With regard to claim 8, Fu further discloses that the output device comprises a printer (Figs. 1A-1E).

Fu further discloses the scanner, digital camera or floppy disk for inputting the input image, as required by claims 9-11 (Figs.1A-1E; column 5, lines 4-5 and 11-12).

With regard to claim 12, Fu further discloses a personal computer to facilitate copying of said input image (Fig.1C).

Claim 13 is drawn to a recording medium containing computer code for implementing an image recognition method which corresponds to the device of claim 1. Fu discloses this at column 5, line 4-10.

As to claim 14, Fu discloses a method of processing an image, said method comprising:

inputting a reference image (column 3, lines 4-12);

determining target pattern elements for said reference image by dividing said reference image into a plurality of regions (column 3, lines 37-41);

determining arrangement data for said target pattern elements (column 3, lines 4-15);

inputting data for an input image (Fig.6, input to element 601);

determining input elements for said input image by dividing said input image

Art Unit: 2623

into said plurality of regions corresponding to said reference image (column 3, lines 9-10); and

comparing said target pattern elements and said input elements (column 3, lines 12-15).

As to claim 15, Fu discloses the method of claim 14, wherein said comparing comprises comparing said target pattern elements and said input elements relative position to each other using said arrangement data (the templates, column 3, lines 40-41).

As to claim 16, Fu discloses the method of claim 14 further comprising halting the process if said target pattern elements include said input elements based on said comparing (column 6, lines 48-51).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was

Art Unit: 2623

not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

6. Claims 3-6 and 8-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Matsugu.

Regarding claims 3-6, Matsugu is silent with regard to the dictionary generating unit, the element matching unit, the arrangement data generating unit, and the pattern detection unit comprising software routines. However, the Examiner takes Official Notice that utilizing software routines to implement functions are well known in the art. Given the widespread use of computers and software in the art, and the flexibility offered by software implementation, it would have been obvious to one of ordinary skill in the art to utilize software routines to implement the various units in Matsugu's device. Further, the fact that Matsugu's device is CPU based (see fig.1A) would have provided further motivation for making the modification.

With regard to claim 8, Matsugu does not disclose that the output device comprises a printer. However, the Examiner takes Official Notice that printers as output devices are well known in the art. It would have been obvious to one ordinary skill in the art to utilize an output device which met his or her needs. This would include any known output device such as a printer.

Matsugu does not disclose the scanner, digital camera or floppy disk for inputting the input image, as required by claims 9-11. However, the Examiner takes Official Notice that each of these are exceedingly well known for inputting images. It would

Art Unit: 2623

have been obvious to one of ordinary skill in the art to utilize a device which would meet his or her needs for a given application. This would include any of a scanner, digital camera or floppy disk.

With regard to claim 12, Matsugu does not disclose a personal computer to facilitate copying of said input image. However, the Examiner takes Official Notice that personal computers are well known, and are well known for facilitating copying of images. It would have been obvious to one of ordinary skill in the art to utilize a computer, given the widespread use of computers in the field. Further since, Matsugu's device is a reproduction apparatus, it would also have been obvious to utilize it to copy the input image.

Claim 13 is drawn to a recording medium containing computer code for implementing an image recognition method which corresponds to the device of claim 1. While Matsugu does not disclose use of a computer, and therefore does not disclose the claimed recording medium, the Examiner takes Official Notice that utilizing computers and associated recording media containing computer code for implementing methods is well known in the art. Given the widespread use of computers and software in the art, and the flexibility offered by software implementation, it would have been obvious to one of ordinary skill in the art to utilize them to implement Matsugu's device.

7. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fu.

As to claim 18, Fu does not disclose reducing the resolution of a reproduction of said input image if said target pattern elements include said input elements based on

Art Unit: 2623

said comparing. The Examiner takes Official Notice that reducing the resolution of a reproduction is well known in the art. It would have been obvious to one of ordinary skill in the art to implement this technique in Fu because it would allow a person to easily distinguish a reproduction from an original.

8. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Fu and U.S. Patent 5,583,614 to Hasuo et al. (hereinafter "Hasuo").

As to claim 17, Fu does not disclose changing the color of a reproduction of said input image if said target pattern elements include said input elements based on said comparing. However, Hasuo teaches outputting an image in a different color if it is determined that an input image is money (i.e., should not be copied) based on a comparison (Fig.6). It would have been obvious to employ Hasuo's technique in Fu's method because this would allow a person to easily see that a printed document is a copy, and not an original. This would be important for documents which should not be copied exactly, such as money, for example.

9. Claims 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Fu and U.S. Patent 5,257,119 to Funada et al. (hereinafter "Funada").

As to claim 19, Fu does not disclose superimposing an alphanumeric character on top of a reproduction of said input image if said target pattern elements include said input elements based on said comparing. However, Funada teaches superimposing alphanumeric characters on top of a reproduction of an input image when it is

Art Unit: 2623

determined that the input image is confidential based on the presence of certain information in the image (e.g., Fig.10; column 8, line 46 to column 9, line 11). It would have been obvious to employ Funada's technique in Fu's method because this would allow a person to easily see that a printed document is a copy, and not an original. This would be important for documents which should not be copied, such as confidential documents, for example.

References Cited

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

U.S. Patent 4,131,879 to Ehrat discloses a method and apparatus for determining the relative positions of corresponding points or zones of a sample and an original.

U.S. Patent 4,955,062 to Terui discloses a pattern detecting method that divides an image of the pattern into plural portions and detects the center of the image of the pattern in each portion, and determines the position of the center of the image of the pattern on the basis of the data obtained by the detection made with regard to each portion.

U.S. Patent 5,987,173 to Kohno et al. discloses a interactive drawing recognition processing method and apparatus which extracts feature for each constituent element of a symbol and the relative positional relationship of each constituent element.

Art Unit: 2623

U.S. Patent 5,640,253 to Uchica et al. teaches outputting an image in a different color.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jon Chang whose telephone number is (703)305-8439. The examiner can normally be reached on M-F 8:00 a.m.-6:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amelia Au can be reached on (703)308-6604. The fax phone numbers for the organization where this application or proceeding is assigned are (703)872-9314 for regular communications and (703)872-9314 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703)305-4700.
